# OTT Platform Overview

# The Big Picture

The iGame OTT platform is a video streaming service which combines direct feeds from StatsPerform and regional broadcasters worldwide powered by InPlay IPTV into a centralised web platform delivering high definition, ultra-low-latency live streaming services.

- We have replaced every piece of hardware in our global estate – including overhauling and rebuilding our global video network. Our existing 650kb ultra-low-latency video is now matched with a high quality 3mb 720p sub-second latency alternative for those who require greater detail whilst trading or monitoring live events.
- The OTT platform gives users the ability to watch up to four streams simultaneously in various ultra-low-latency formats. With over 70,000 Live events streamed annually, this is the world's most powerful and comprehensive streaming solution.
- Our High-resolution video-on-demand (VOD) service allows users to watch historical events for video analysis, settlement validation and download video recordings for local storage purposes.
- Our master control room (MCR) team provides on-site support 24 hours a day, 365 days a year, with built in redundancy measures to safeguard against electrical failure or internet outages, ensuring the service never drops.

# Any device, any location

The legacy W&T product required application-based installation and was only supported by Windows. Our new OTT platform is purely web-based meaning it's accessible by most common internet browsers, with the best performance being observed on Chrome.

Extensive new security features give clients administrative control over their users and allow them to control individual device permissions. Trading managers can now assign licences to traders and maintain control over their access, as well as ensuring that their access is not shared.

Make no mistake, our OTT solution now offers full flexibility to its users in the office, at home or even on the beach in the Maldives!

# Access Security Assurance

Our OTT application is designed to ensure maximum control to authorised users offering of clients 2 defined methods that safeguards their access security, including device restriction configurations to prevent misuse.

## Method 1

Applied through a licensed user approach that links individual users to their MAC address of their chosen machine with a valid username and password. Access is 100% controlled by the client to create their users and assign respective accounts.

## Method 2

We have created the ability to link our OTT product to Clients Office 365 Azure active directory, allowing for further security privileges against single sign on authentication, all achieved through domain whitelisting, and removes the administrative needs to manage users, passwords, and access.

The image shows a login interface for iGameMedia. On the left, a white panel contains input fields for 'Username' and 'Password', a dark blue 'Sign in' button, a 'Sign in with Microsoft' button with the Microsoft logo, and a 'Reset password' button. On the right, a dark blue panel features the iGameMedia logo, which consists of a stylized white and red 'i' icon followed by the text 'iGame Media' in white.

# Live Streaming Formats

## HD Live

HD Live is a 3mb stream delivered with sub-second latency in 720p high-definition resolution. This is the highest definition feed we offer and gives users the ability to view the stream in the highest possible quality without sacrificing speed.

## SD Live

SD Live is a 650kb stream delivered with sub-second latency in 576p resolution. This format gives users the ability to view a good quality stream, while maintaining relatively low data usage.

# Live Review

Review is a 3mb stream delivered in 720p high-definition resolution via HLS. Users have the ability to:

- Rewind the stream to any timestamp
- Rewind and fast forward by a set number of seconds (2, 7 or 30)
- Set the video into rewind mode
- Move the video frame by frame
- Alter the playback speed of the video from 0.1x up to 8x

# Comprehensive Video Archive

iGame offers clients the ability to download recorded content in high-resolution that delivers outright video clarity and performance, suitable for any archiving & video editing needs.

# TV Gantry Display Solution

iGame offers the ability to Host, transcode and render Client's acquired content from their own set top box subscriptions, delivered in ultra-high resolution (8Mbps/H264) with assured latency up to 700ms.

Our solution streamlines the content viewing process through our OTT solution, allowing full control of the channel access by using our intuitive remote-control interface, allowing Clients to stream content within their office & tv wall displays.

# Full Event Schedule Integration

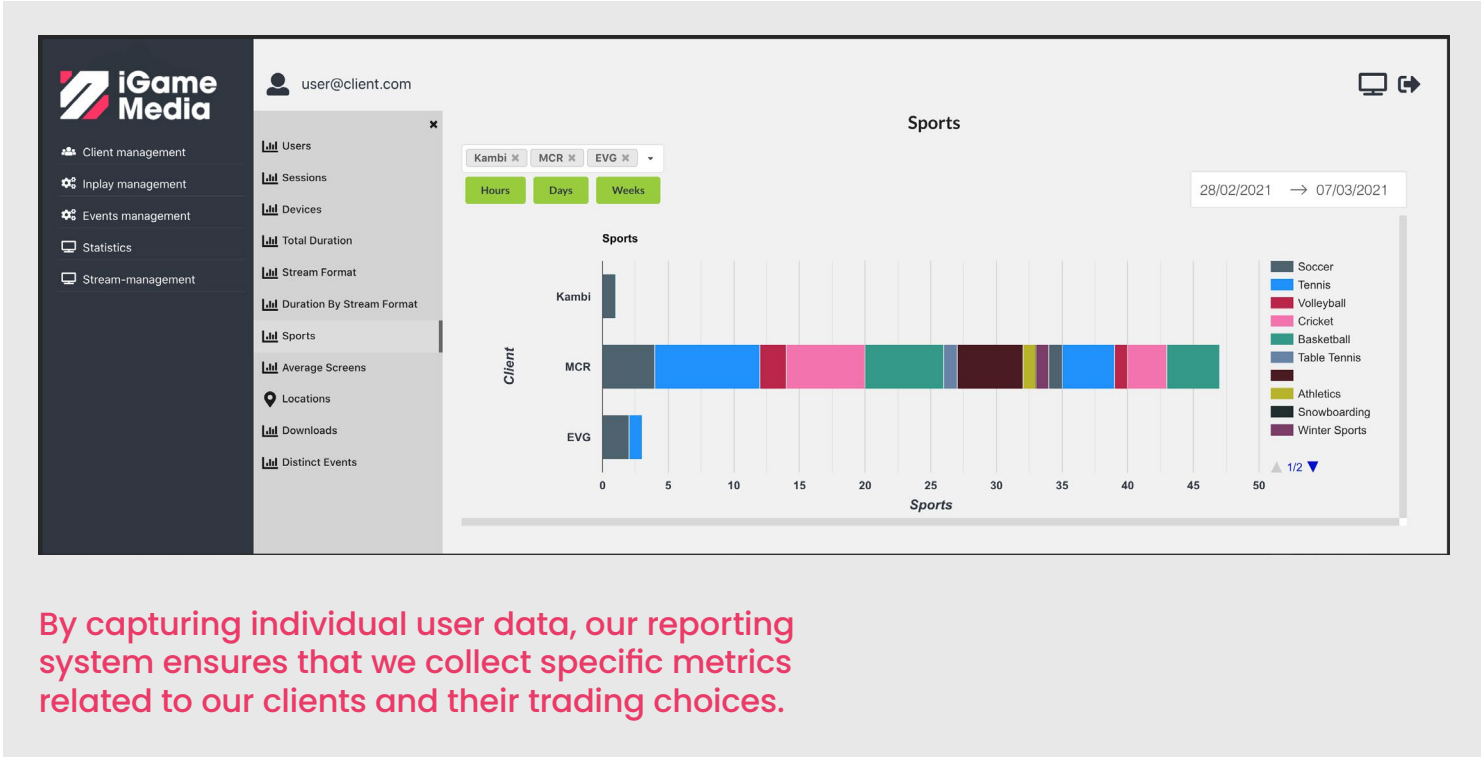

Our full schedule of events is available to download in your preferred format (PDF/CSV/XML/JSON) to assist with schedule integration.
